

Version: 1.0.0

Revolut X Crypto Exchange REST API

As a Revolut X customer, you can use the Revolut X REST API to streamline your trading experience.

API key

To get started using the Revolut X REST API, you need an API key to include with your requests. To create it, follow the instructions below.

Generate an Ed25519 key pair

Before creating your API key in the [Revolut X web app](#), you must first generate an Ed25519 key pair.

An Ed25519 key pair consists of a private key and a public key. The private key is kept secret and used for signing data or authenticating, while the public key can be shared to verify signatures and authenticate access.

You can generate this pair using `openssl`.

1. Generate the private key

Run the following command in your terminal:

```
openssl genpkey -algorithm ed25519 -out private.pem
```

This command generates a file named `private.pem`, which contains your private key. It has the following structure:

```
-----BEGIN PRIVATE KEY-----  
{YOUR BASE64-ENCODED PRIVATE KEY}  
-----END PRIVATE KEY-----
```

❌ IMPORTANT: Secure your private key

This is your **private** key, and it will be used for signing requests. **Your private key is a secret.** Never share it with anyone and never send it as a part of any request.

2. Generate the public key

Next, generate the public key from your [private key](#):

```
openssl pkey -in private.pem -pubout -out public.pem
```

This command generates a file named `public.pem` with your public key. It has the following structure:

```
-----BEGIN PUBLIC KEY-----  
{YOUR BASE64-ENCODED PUBLIC KEY}  
-----END PUBLIC KEY-----
```

ⓘ About your public key

This is your **public** key. It is not secret, and it is safe to share. You will provide this key to Revolut X so we can verify the requests signed with your matching private key.

When you provide it, make sure that you copy all of it, including the `-----BEGIN KEY-----` and `-----END KEY-----` lines.

Create your API key

Once you have your **public key** (the content of `public.pem`), you are ready to create your API key.

Go to the [Revolut X web app](#) → **Profile** to complete the setup.

Authentication headers

This API uses a custom [authentication](#) scheme based on Ed25519 signatures. Every request to the API must include the following headers:

Header	Description
X-Revx-API-Key	Your API key (64-character alphanumeric string).
X-Revx-Timestamp	The Unix timestamp of the request, provided in milliseconds .
X-Revx-Signature	The request digest string signed with your private key .

Signing a request

To generate the `X-Revx-Signature`, you must sign a specific string constructed from your request data.

1. Construct the message string

The string to sign is a concatenation of the following values, in this specific order:

- 1 **Timestamp:** Same value as the `X-Revx-Timestamp` header.
- 2 **HTTP Method:** Uppercase (e.g., `GET`, `POST`).
- 3 **Request Path:** The path starting from `/api` (e.g., `/api/1.0/orders/active`).
- 4 **Query String:** The URL query string if present (e.g., `limit=10`). Do not include the `?`.
- 5 **Request Body:** The minified JSON body string, if present.

Note

When concatenating, do not add any separators (spaces, newlines, or commas) between the fields.

Example Message:

```
1765360896219POST/api/1.0/orders{"client_order_id":"3b364427-1f4f-4f66-9935-86b6fb115d26","symbol":"BTC-USD","side":"BUY","order_configuration":{"limit":{"base_size":"0.1","price":"90000.1"}}}
```

2. Sign the message

- 1 Sign the constructed string using your **Ed25519 private key**.

- 2 **Base64-encode** the resulting signature.
- 3 Send this value in the `X-Revx-Signature` header.

API endpoints

To see the reference for the specific endpoints and operations of this API, browse the menu on the left.

Authentication

API Key: `ApiKey`

The [API key](#) obtained from the [Revolut X web app](#). It takes the form of a 64-character alphanumeric string, and must be provided with other [authentication headers](#).

A sample API key might look like this:

```
M1VKFtwB0M9C9QJ07goPlwr0ytrJsSNE19txsmpsWIKz7xYu3f8aNucIyynAhYBy
```

Each API key directly maps to the user account (either Business or Retail).

Security Scheme Type:	apiKey
Header parameter name:	X-Revx-API-Key
